1 INTRODUCTION

OVERVIEW
Introduction
Definition of the Laser
Simplicity of a Laser
Unique Properties of a Laser
The Laser Spectrum and Wavelengths
A Brief History of the Laser
Overview of the Book

SECTION 1. FUNDAMENTAL WAVE PROPERTIES OF LIGHT

2 WAVE NATURE OF LIGHT – THE INTERACTION OF LIGHT WITH MATERIALS

OVERVIEW
2.1 Maxwell’s Equations
2.2 Maxwell’s Wave Equations

Maxwell’s Wave Equations for a Vacuum
Solution of the General Wave Equation – Equivalence of Light and Electromagnetic Radiation
Wave Velocity – Phase and Group Velocities
Generalized Solution of the Wave Equation
Transverse Electromagnetic Waves and Polarized Light
Flow of Electromagnetic Energy
Radiation from a Point Source (Electric Dipole Radiation)

2.3 Interaction of Electromagnetic Radiation (Light) with Matter

Speed of Light in a Medium
Maxwell’s Equations in a Medium
Application of Maxwell’s Equations to Dielectric Materials – Laser Gain Media
Complex Index of Refraction – Optical Constants
Absorption and Dispersion
## CONTENTS

Estimating Particle Densities of Materials for Use in the Dispersion Equations 34

2.4 Coherence 36
   Temporal Coherence 37
   Spatial Coherence 38

REFERENCES 39

PROBLEMS 39

## SECTION 2. FUNDAMENTAL QUANTUM PROPERTIES OF LIGHT

3 PARTICLE NATURE OF LIGHT – DISCRETE ENERGY LEVELS 45

### OVERVIEW 45

3.1 Bohr Theory of the Hydrogen Atom 45
   Historical Development of the Concept of Discrete Energy Levels 45
   Energy Levels of the Hydrogen Atom 46
   Frequency and Wavelength of Emission Lines 49
   Ionization Energies and Energy Levels of Ions 51
   Photons 54

3.2 Quantum Theory of Atomic Energy Levels 54
   Wave Nature of Particles 54
   Heisenberg Uncertainty Principle 56
   Wave Theory 56
   Wave Functions 57
   Quantum States 57
   The Schrödinger Wave Equation 59
   Energy and Wave Function for the Ground State of the Hydrogen Atom 61
   Excited States of Hydrogen 63
   Allowed Quantum Numbers for Hydrogen Atom Wave Functions 66

3.3 Angular Momentum of Atoms 67
   Orbital Angular Momentum 67
   Spin Angular Momentum 68
   Total Angular Momentum 69

3.4 Energy Levels Associated with One-Electron Atoms 70
   Fine Structure of Spectral Lines 70
   Pauli Exclusion Principle 72

3.5 Periodic Table of the Elements 72
   Quantum Conditions Associated with Multiple Electrons Attached to Nuclei 72
   Shorthand Notation for Electronic Configurations of Atoms Having More Than One Electron 76

3.6 Energy Levels of Multi-Electron Atoms 77
   Energy-Level Designation for Multi-Electron States 77
   Russell–Saunders or \( LS \) Coupling – Notation for Energy Levels 78
   Energy Levels Associated with Two Electrons in Unfilled Shells 79
   Rules for Obtaining \( S, L, \) and \( J \) for \( LS \) Coupling 82
   Degeneracy and Statistical Weights 84
   \( j-j \) Coupling 85
   Isoelectronic Scaling 85
## 4 RADIATIVE TRANSITIONS AND EMISSION LINEWIDTH

### OVERVIEW

- Radiative Decay of Excited States of Isolated Atoms – Spontaneous Emission
- Spontaneous Emission Decay Rate – Radiative Transition Probability
- Lifetime of a Radiating Electron – The Electron as a Classical Radiating Harmonic Oscillator
- Nonradiative Decay of the Excited States – Collisional Decay

### 4.1 Decay of Excited States

- Radiative Decay of Excited States of Isolated Atoms – Spontaneous Emission
- Spontaneous Emission Decay Rate – Radiative Transition Probability
- Lifetime of a Radiating Electron – The Electron as a Classical Radiating Harmonic Oscillator
- Nonradiative Decay of the Excited States – Collisional Decay

### 4.2 Emission Broadening and Linewidth Due to Radiative Decay

- Classical Emission Linewidth of a Radiating Electron
- Natural Emission Linewidth as Deduced by Quantum Mechanics (Minimum Linewidth)

### 4.3 Additional Emission-Broadening Processes

- Broadening Due to Nonradiative (Collisional) Decay
- Broadening Due to Dephasing Collisions
- Amorphous Crystal Broadening
- Doppler Broadening in Gases
- Voigt Lineshape Profile
- Broadening in Gases Due to Isotope Shifts
- Comparison of Various Types of Emission Broadening

### 4.4 Quantum Mechanical Description of Radiating Atoms

- Electric Dipole Radiation
- Electric Dipole Matrix Element
- Electric Dipole Transition Probability
- Oscillator Strength
- Selection Rules for Electric Dipole Transitions Involving Atoms with a Single Electron in an Unfilled Subshell
- Selection Rules for Radiative Transitions Involving Atoms with More Than One Electron in an Unfilled Subshell
- Parity Selection Rule
- Inefficient Radiative Transitions – Electric Quadrupole and Other Higher-Order Transitions

## 5 ENERGY LEVELS AND RADIATIVE PROPERTIES OF MOLECULES, LIQUIDS, AND SOLIDS

### OVERVIEW

- Molecular Energy Levels and Spectra
- Energy Levels of Molecules
- Classification of Simple Molecules
- Rotational Energy Levels of Linear Molecules
- Rotational Energy Levels of Symmetric-Top Molecules
- Selection Rules for Rotational Transitions
Vibrational Energy Levels 143
Selection Rule for Vibrational Transitions 143
Rotational–Vibrational Transitions 144
Probabilities of Rotational and Vibrational Transitions 148
Electronic Energy Levels of Molecules 149
Electronic Transitions and Associated Selection Rules of Molecules 150
Emission Linewidth of Molecular Transitions 150
The Franck–Condon Principle 151
Excimer Energy Levels 152

5.2 Liquid Energy Levels and Their Radiation Properties 153
Structure of Dye Molecules 153
Energy Levels of Dye Molecules 155
Excitation and Emission of Dye Molecules 156
Detrimental Triplet States of Dye Molecules 157

5.3 Energy Levels in Solids – Dielectric Laser Materials 158
Host Materials 158
Laser Species – Dopant Ions 159
Narrow-Linewidth Laser Materials 161
Broadband Tunable Laser Materials 166
Broadening Mechanism for Solid-State Lasers 168

5.4 Energy Levels in Solids – Semiconductor Laser Materials 168
Energy Bands in Crystalline Solids 168
Energy Levels in Periodic Structures 170
Energy Levels of Conductors, Insulators, and Semiconductors 172
Excitation and Decay of Excited Energy Levels – Recombination Radiation 173
Direct and Indirect Bandgap Semiconductors 174
Electron Distribution Function and Density of States in Semiconductors 175
Intrinsic Semiconductor Materials 179
Extrinsic Semiconductor Materials – Doping 179
p–n Junctions – Recombination Radiation Due to Electrical Excitation 182
Heterojunction Semiconductor Materials 184
Quantum Wells 186
Variation of Bandgap Energy and Radiation Wavelength with Alloy Composition 191
Recombination Radiation Transition Probability and Linewidth 195

REFERENCES 195

**SECTION 3. LASER AMPLIFIERS**

7 CONDITIONS FOR PRODUCING A LASER – POPULATION INVERSIONS, GAIN, AND GAIN SATURATION | 225 |
| OVERVIEW | 225 |
| 7.1 Absorption and Gain | 225 |
| | Absorption and Gain on a Homogeneously Broadened Radiative Transition (Lorentzian Frequency Distribution) | 225 |
| | Gain Coefficient and Stimulated Emission Cross Section for Homogeneous Broadening | 229 |
| | Absorption and Gain on an Inhomogeneously Broadened Radiative Transition (Doppler Broadening with a Gaussian Distribution) | 230 |
| | Gain Coefficient and Stimulated Emission Cross Section for Doppler Broadening | 231 |
| | Statistical Weights and the Gain Equation | 232 |
| | Relationship of Gain Coefficient and Stimulated Emission Cross Section to Absorption Coefficient and Absorption Cross Section | 233 |
| 7.2 Population Inversion (Necessary Condition for a Laser) | 234 |
| 7.3 Saturation Intensity (Sufficient Condition for a Laser) | 235 |
| 7.4 Development and Growth of a Laser Beam | 238 |
| | Growth of Beam for a Gain Medium with Homogeneous Broadening | 238 |
| | Shape or Geometry of Amplifying Medium | 241 |
| | Growth of Beam for Doppler Broadening | 244 |
| 7.5 Exponential Growth Factor (Gain) | 245 |
| 7.6 Threshold Requirements for a Laser | 247 |
| | Laser with No Mirrors | 247 |
| | Laser with One Mirror | 248 |
| | Laser with Two Mirrors | 249 |
| REFERENCES | 253 |
| PROBLEMS | 253 |

8 LASER OSCILLATION ABOVE THRESHOLD 255

OVERVIEW 255

8.1 Laser Gain Saturation 255
   Rate Equations of the Laser Levels That Include Stimulated Emission 255
   Population Densities of Upper and Lower Laser Levels with Beam Present 256
   Small-Signal Gain Coefficient 257
   Saturation of the Laser Gain above Threshold 257

8.2 Laser Beam Growth beyond the Saturation Intensity 258
   Change from Exponential Growth to Linear Growth 258
   Steady-State Laser Intensity 261

8.3 Optimization of Laser Output Power 261
   Optimum Output Mirror Transmission 261
   Optimum Laser Output Intensity 264
   Estimating Optimum Laser Output Power 264

8.4 Energy Exchange between Upper Laser Level Population and Laser Photons 266
   Decay Time of a Laser Beam within an Optical Cavity 267
   Basic Laser Cavity Rate Equations 268
   Steady-State Solutions below Laser Threshold 270
   Steady-State Operation above Laser Threshold 272

8.5 Laser Output Fluctuations 273
   Laser Spiking 273
   Relaxation Oscillations 276

8.6 Laser Amplifiers 279
   Basic Amplifier Uses 279
   Propagation of a High-Power, Short-Duration Optical Pulse through an Amplifier 280
   Saturation Energy Fluence 282
   Amplifying Long Laser Pulses 284
   Amplifying Short Laser Pulses 284
   Comparison of Efficient Laser Amplifiers Based upon Fundamental Saturation Limits 285
   Mirror Array and Resonator (Regenerative) Amplifiers 285

REFERENCES 288
PROBLEMS 288

9 REQUIREMENTS FOR OBTAINING POPULATION INVERSIONS 290

OVERVIEW 290

9.1 Inversions and Two-Level Systems 290

9.2 Relative Decay Rates – Radiative versus Collisional 292

9.3 Steady-State Inversions in Three- and Four-Level Systems 293
   Three-Level Inversions in Three- and Four-Level Systems 295
   Three-Level Laser with the Intermediate Level as the Upper Laser Level 295
   Three-Level Laser with the Upper Laser Level as the Highest Level 298
   Four-Level Laser 301

9.4 Transient Population Inversions 304
CONTENTS

9.5 Processes That Inhibit or Destroy Inversions 307
- Radiation Trapping in Atoms and Ions 308
- Electron Collisional Thermalization of the Laser Levels in Atoms and Ions 311
- Comparison of Radiation Trapping and Electron Collisional Mixing in a Gas Laser 315
- Absorption within the Gain Medium 316

PROBLEMS 319

10 LASER PUMPING REQUIREMENTS AND TECHNIQUES 322
OVERVIEW 322
10.1 Excitation or Pumping Threshold Requirements 322
10.2 Pumping Pathways 324
- Excitation by Direct Pumping 324
- Excitation by Indirect Pumping (Pump and Transfer) 327
- Specific Pump-and-Transfer Processes 330
10.3 Specific Excitation Parameters Associated with Optical Pumping 339
- Pumping Geometries 339
- Pumping Requirements 342
- A Simplified Optical Pumping Approximation 344
- Transverse Pumping 346
- End Pumping 348
- Diode Pumping of Solid-State Lasers 350
- Characterization of a Laser Gain Medium with Optical Pumping (Slope Efficiency) 352
10.4 Specific Excitation Parameters Associated with Particle Pumping 355
- Electron Collisional Pumping 355
- Heavy Particle Pumping 359
- A More Accurate Description of Electron Excitation Rate to a Specific Energy Level in a Gas Discharge 359
- Electrical Pumping of Semiconductors 361
REFERENCES 363
PROBLEMS 364

SECTION 4. LASER RESONATORS

11 LASER CAVITY MODES 371
OVERVIEW 371
11.1 Introduction 371
11.2 Longitudinal Laser Cavity Modes 372
- Fabry–Perot Resonator 372
- Fabry–Perot Cavity Modes 379
- Longitudinal Laser Cavity Modes 380
- Longitudinal Mode Number 380
- Requirements for the Development of Longitudinal Laser Modes 382
CONTENTS

11.3 Transverse Laser Cavity Modes 384
   Fresnel–Kirchhoff Diffraction Integral Formula 385
   Development of Transverse Modes in a Cavity with Plane-Parallel Mirrors 386
   Transverse Modes Using Curved Mirrors 390
   Transverse Mode Spatial Distributions 391
   Transverse Mode Frequencies 392
   Gaussian-Shaped Transverse Modes within and beyond the Laser Cavity 393
11.4 Properties of Laser Modes 396
   Mode Characteristics 396
   Effect of Modes on the Gain Medium Profile 397
REFERENCES 399
PROBLEMS 399

12 STABLE LASER RESONATORS AND GAUSSIAN BEAMS 402
OVERVIEW 402
12.1 Stable Curved Mirror Cavities 402
   Curved Mirror Cavities 402
   ABCD Matrices 404
   Cavity Stability Criteria 406
12.2 Properties of Gaussian Beams 410
   Propagation of a Gaussian Beam 411
   Gaussian Beam Properties of Two-Mirror Laser Cavities 412
   Properties of Specific Two-Mirror Laser Cavities 417
   Mode Volume of a Hermite–Gaussian Mode 421
12.3 Properties of Real Laser Beams 423
12.4 Propagation of Gaussian Beams Using ABCD Matrices – Complex Beam Parameter 425
   Complex Beam Parameter Applied to a Two-Mirror Laser Cavity 428
REFERENCES 432
PROBLEMS 432

13 SPECIAL LASER CAVITIES AND CAVITY EFFECTS 434
OVERVIEW 434
13.1 Unstable Resonators 434
13.2 Q-Switching 439
   General Description 439
   Theory 441
   Methods of Producing Q-Switching within a Laser Cavity 446
13.3 Gain-Switching 450
13.4 Mode-Locking 451
   General Description 451
   Theory 451
   Techniques for Producing Mode-Locking 456
13.5 Pulse Shortening Techniques 462
   Self-Phase Modulation 463
   Pulse Shortening or Lengthening Using Group Velocity Dispersion 464
   Pulse Compression (Shortening) with Gratings or Prisms 465
   Ultrashort-Pulse Laser and Amplifier System 467
### 13.6 Ring Lasers
- Monolithic Unidirectional Single-Mode Nd:YAG Ring Laser 469
- Two-Mirror Ring Laser 470

### 13.7 Complex Beam Parameter Analysis Applied to Multi-Mirror Laser Cavities
- Three-Mirror Ring Laser Cavity 470
- Three- or Four-Mirror Focused Cavity 473

### 13.8 Cavities for Producing Spectral Narrowing of Laser Output
- Cavity with Additional Fabry–Perot Etalon for Narrow-Frequency Selection 478
- Tunable Cavity 478
- Broadband Tunable cw Ring Lasers 480
- Tunable Cavity for Ultrannarrow-Frequency Output 480
- Distributed Feedback (DFB) Lasers 481
- Distributed Bragg Reflection Lasers 484

### 13.9 Laser Cavities Requiring Small-Diameter Gain Regions – Astigmatically Compensated Cavities

### 13.10 Waveguide Cavities for Gas Lasers

Introduction

OVERVIEW A laser is a device that amplifies light and produces a highly directional, high-intensity beam that most often has a very pure frequency or wavelength. It comes in sizes ranging from approximately one tenth the diameter of a human hair to the size of a very large building, in powers ranging from $10^{-9}$ to $10^{20}$ W, and in wavelengths ranging from the microwave to the soft-X-ray spectral regions with corresponding frequencies from $10^{13}$ to $10^{17}$ Hz. Lasers have pulse energies as high as $10^4$ J and pulse durations as short as $5 \times 10^{-15}$ s. They can easily drill holes in the most durable of materials and can weld detached retinas within the human eye. They are a key component of some of our most modern communication systems and are the “phonograph needle” of our compact disc players. They perform heat treatment of high-strength materials, such as the pistons of our automobile engines, and provide a special surgical knife for many types of medical procedures. They act as target designators for military weapons and provide for the rapid check-out we have come to expect at the supermarket. What a remarkable range of characteristics for a device that is in only its fifth decade of existence!

INTRODUCTION There is nothing magical about a laser. It can be thought of as just another type of light source. It certainly has many unique properties that make it a special light source, but these properties can be understood without knowledge of sophisticated mathematical techniques or complex ideas. It is the objective of this text to explain the operation of the laser in a simple, logical approach that builds from one concept to the next as the chapters evolve. The concepts, as they are developed, will be applied to all classes of laser materials, so that the reader will develop a sense of the broad field of lasers while still acquiring the capability to study, design, or simply understand a specific type of laser system in detail.

DEFINITION OF THE LASER The word laser is an acronym for Light Amplification by Stimulated Emission of Radiation. The laser makes use of processes that increase or amplify light signals after those signals have been generated by other means. These processes include (1) stimulated emission, a natural effect that was deduced by considerations relating to thermodynamic equilibrium, and (2) optical feedback (present in most
INTRODUCTION

Figure 1-1  Simplified schematic of typical laser

lasers) that is usually provided by mirrors. Thus, in its simplest form, a laser consists of a gain or amplifying medium (where stimulated emission occurs), and a set of mirrors to feed the light back into the amplifier for continued growth of the developing beam, as seen in Figure 1-1.

SIMPLICITY OF A LASER

The simplicity of a laser can be understood by considering the light from a candle. Normally, a burning candle radiates light in all directions, and therefore illuminates various objects equally if they are equidistant from the candle. A laser takes light that would normally be emitted in all directions, such as from a candle, and concentrates that light into a single direction. Thus, if the light radiating in all directions from a candle were concentrated into a single beam of the diameter of the pupil of your eye (approximately 3 mm), and if you were standing a distance of 1 m from the candle, then the light intensity would be 1,000,000 times as bright as the light that you normally see radiating from the candle! That is essentially the underlying concept of the operation of a laser. However, a candle is not the kind of medium that produces amplification, and thus there are no candle lasers. It takes relatively special conditions within the laser medium for amplification to occur, but it is that capability of taking light that would normally radiate from a source in all directions – and concentrating that light into a beam traveling in a single direction – that is involved in making a laser. These special conditions, and the media within which they are produced, will be described in some detail in this book.

UNIQUE PROPERTIES OF A LASER

The beam of light generated by a typical laser can have many properties that are unique. When comparing laser properties to those of other light sources, it can be readily recognized that the values of various parameters for laser light either greatly exceed or are much more restrictive than the values for many common light sources. We never use lasers for street illumination, or for illumination within our houses. We don’t use them for searchlights or flashlights or as headlights in
our cars. Lasers generally have a narrower frequency distribution, or much higher intensity, or a much greater degree of collimation, or much shorter pulse duration, than that available from more common types of light sources. Therefore, we do use them in compact disc players, in supermarket check-out scanners, in surveying instruments, and in medical applications as a surgical knife or for welding detached retinas. We also use them in communications systems and in radar and military targeting applications, as well as many other areas. A laser is a specialized light source that should be used only when its unique properties are required.

THE LASER SPECTRUM AND WAVELENGTHS

A portion of the electromagnetic radiation spectrum is shown in Figure 1-2 for the region covered by currently existing lasers. Such lasers span the wavelength range from the far infrared part of the spectrum (\( \lambda = 1,000 \mu m \)) to the soft–X-ray region (\( \lambda = 3 \) nm), thereby covering a range of wavelengths of almost six orders of magnitude. There are several types of units that are used to define laser wavelengths. These range from micrometers or microns (\( \mu m \)) in the infrared to nanometers (nm) and angstroms (Å) in the visible, ultraviolet (UV), vacuum ultraviolet (VUV), extreme ultraviolet (EUV or XUV), and soft–X-ray (SXR) spectral regions.

WAVELENGTH UNITS

\[
\begin{align*}
1 \mu m &= 10^{-6} m; \\
1 \AA &= 10^{-10} m; \\
1 \text{nm} &= 10^{-9} m.
\end{align*}
\]

Consequently, 1 micron (\( \mu m \)) = 10,000 angstroms (Å) = 1,000 nanometers (nm). For example, green light has a wavelength of \( 5 \times 10^{-7} m = 0.5 \mu m = 5,000 \AA = 500 \text{nm} \).

INTRODUCTION

WAVELENGTH REGIONS

Far infrared: 10 to 1,000 µm;
middle infrared: 1 to 10 µm;
near infrared: 0.7 to 1 µm;
visible: 0.4 to 0.7 µm, or 400 to 700 nm;
ultraviolet: 0.2 to 0.4 µm, or 200 to 400 nm;
vacuum ultraviolet: 0.1 to 0.2 µm, or 100 to 200 nm;
extreme ultraviolet: 10 to 100 nm;
soft X-rays: 1 nm to approximately 20–30 nm (some overlap with EUV).

A BRIEF HISTORY OF THE LASER

Charles Townes took advantage of the stimulated emission process to construct a microwave amplifier, referred to as a maser. This device produced a coherent beam of microwaves to be used for communications. The first maser was produced in ammonia vapor with the inversion between two energy levels that produced gain at a wavelength of 1.25 cm. The wavelengths produced in the maser were comparable to the dimensions of the device, so extrapolation to the optical regime — where wavelengths were five orders of magnitude smaller — was not an obvious extension of that work.

In 1958, Townes and Schawlow published a paper concerning their ideas about extending the maser concept to optical frequencies. They developed the concept of an optical amplifier surrounded by an optical mirror resonant cavity to allow for growth of the beam. Townes and Schawlow each received a Nobel Prize for his work in this field.

In 1960, Theodore Maiman of Hughes Research Laboratories produced the first laser using a ruby crystal as the amplifier and a flashlamp as the energy source. The helical flashlamp surrounded a rod-shaped ruby crystal, and the optical cavity was formed by coating the flattened ends of the ruby rod with a highly reflecting material. An intense red beam was observed to emerge from the end of the rod when the flashlamp was fired!

The first gas laser was developed in 1961 by A. Javan, W. Bennett, and D. Harriott of Bell Laboratories, using a mixture of helium and neon gases. At the same laboratories, L. F. Johnson and K. Nassau demonstrated the first neodymium laser, which has since become one of the most reliable lasers available. This was followed in 1962 by the first semiconductor laser, demonstrated by R. Hall at the General Electric Research Laboratories. In 1963, C. K. N. Patel of Bell Laboratories discovered the infrared carbon dioxide laser, which is one of the most efficient and powerful lasers available today. Later that same year, E. Bell of Spectra Physics discovered the first ion laser, in mercury vapor. In 1964 W. Bridges of Hughes Research Laboratories discovered the argon ion laser, and in 1966 W. Silfvast, G. R. Fowles, and B. D. Hopkins produced the first blue helium–cadmium metal vapor
laser. During that same year, P. P. Sorokin and J. R. Lankard of the IBM Research Laboratories developed the first liquid laser using an organic dye dissolved in a solvent, thereby leading to the category of broadly tunable lasers. Also at that time, W. Walter and co-workers at TRG reported the first copper vapor laser.

The first vacuum ultraviolet laser was reported to occur in molecular hydrogen by R. Hodgson of IBM and independently by R. Waynant et al. of the Naval Research Laboratories in 1970. The first of the well-known rare-gas–halide excimer lasers was observed in xenon fluoride by J. J. Ewing and C. Brau of the Avco–Everett Research Laboratory in 1975. In that same year, the first quantum-well laser was made in a gallium arsenide semiconductor by J. van der Ziel and co-workers at Bell Laboratories. In 1976, J. M. J. Madey and co-workers at Stanford University demonstrated the first free-electron laser amplifier operating in the infrared at the CO2 laser wavelength. In 1979, Walling and co-workers at Allied Chemical Corporation obtained broadly tunable laser output from a solid-state laser material called alexandrite, and in 1985 the first soft-X-ray laser was successfully demonstrated in a highly ionized selenium plasma by D. Matthews and a large number of co-workers at the Lawrence Livermore Laboratories. In 1986, P. Moulton discovered the titanium sapphire laser. In 1991, M. Hasse and co-workers developed the first blue-green diode laser in ZnSe. In 1994, F. Capasso and co-workers developed the quantum cascade laser. In 1996, S. Nakamura developed the first blue diode laser in GaN-based materials.

In 1961, Fox and Li described the existence of resonant transverse modes in a laser cavity. That same year, Boyd and Gordon obtained solutions of the wave equation for confocal resonator modes. Unstable resonators were demonstrated in 1969 by Krupke and Sooy and were described theoretically by Siegman. Q-switching was first obtained by McClung and Hellwarth in 1962 and described later by Wagner and Lengyel. The first mode-locking was obtained by Hargrove, Fork, and Pollack in 1964. Since then, many special cavity arrangements, feedback schemes, and other devices have been developed to improve the control, operation, and reliability of lasers.

**OVERVIEW OF THE BOOK**

Isaac Newton described light as small bodies emitted from shining substances. This view was no doubt influenced by the fact that light appears to propagate in a straight line. Christian Huygens, on the other hand, described light as a wave motion in which a small source spreads out in all directions; most observed effects—including diffraction, reflection, and refraction—can be attributed to the expansion of primary waves and of secondary wavelets. The dual nature of light is still a useful concept, whereby the choice of particle or wave explanation depends upon the effect to be considered.

Section One of this book deals with the fundamental wave properties of light, including Maxwell’s equations, the interaction of electromagnetic radiation with
matter, absorption and dispersion, and coherence. Section Two deals with the fundamental quantum properties of light. Chapter 3 describes the concept of discrete energy levels in atomic laser species and also how the periodic table of the elements evolved. Chapter 4 deals with radiative transitions and emission linewidths and the probability of making transitions between energy levels. Chapter 5 considers energy levels of lasers in molecules, liquids, and solids – both dielectric solids and semiconductors. Chapter 6 then considers radiation in equilibrium and the concepts of absorption and stimulated emission of radiation. At this point the student has the basic tools to begin building a laser.

Section Three considers laser amplifiers. Chapter 7 describes the theoretical basis for producing population inversions and gain. Chapter 8 examines laser gain and operation above threshold, Chapter 9 describes how population inversions are produced, and Chapter 10 considers how sufficient amplification is achieved to make an intense laser beam. Section Four deals with laser resonators. Chapter 11 considers both longitudinal and transverse modes within a laser cavity, and Chapter 12 investigates the properties of stable resonators and Gaussian beams. Chapter 13 considers a variety of special laser cavities and effects, including unstable resonators, Q-switching, mode-locking, pulse narrowing, ring lasers, and spectral narrowing.

Section Five covers specific laser systems. Chapter 14 describes eleven of the most well-known gas and plasma laser systems. Chapter 15 considers twelve well-known dye lasers and solid-state lasers, including both dielectric solid-state lasers and semiconductor lasers. The book concludes with Section Six (Chapter 16), which provides a brief overview of frequency multiplication with lasers and other nonlinear effects.
